

## **How to: Add Custom Images to a Barista Application Menu**

The Image ID list in Barista Menu Maintenance is compiled directly from image names starting with "im\_menua\_" and found in the `barista/sys/images/` directory. All menu images must reside in that directory.

During the Create Application Wizard, Barista defines an `image_bar/` directory in your project directory. If you place your custom images there, they'll be transferred into the Barista image directory when you sync your application into Barista.

To add a menu image immediately (when you aren't sync'ing Barista), place the image directly in `barista/sys/images`, and rename it to have the "im\_menua\_" prefix. You should also place a copy in the `image_bar/` directory of your project, so you won't lose the image during the next Barista upgrade/sync.
