

Git for AddonSoftware

Git is a filesystem and versioning system that can be used in an AddonSoftware upgrade to merge changes in a released BASIS version with a client's customizations (replicated into a separate project). Rather than modifying files manually, Git resolves most of the changes automatically and brings attention to sections of code where automatic integration is not possible due to BASIS making changes while the client has made another set of changes.

Learn about Git with AddonSoftware and how to use it by following these documents:

- [Using the BASIS Git Archive](#)
- [Upgrading Mods With Git](#)
- [Git Archive](#) (presentation)
